Graniz: Graphite Hole #128 Intersects 7.7% Gp Over 93 Feet, 8.1% Gp Over 64 Feet, 4.2% Gp Over 36 Feet

LÉVIS, QUEBEC--(Marketwired - April 9, 2013) - Graniz Mondal Inc. (TSX VENTURE:GRA.H) ("Graniz Graphite") is pleased to announce another wide intercept of graphite mineralization 100 metres north-west of the initial discovery (hole #120) on the Brunet graphite deposit located 28 miles from North America's only graphite producer IMERY'S TIMCAL near Mont-Laurier. Dr Berthe Lambert, Chairman, comments: "Hole #2013-128 with a vertical length of 263 feet of graphitic marble will add significant new tonnage to the Brunet large flake graphite deposit since this hole is situated 300 feet north-west of hole #120 with 255 vertical feet of graphite marble with graphite grades from 4.5% to 6.4%. The drilling program should allow us to confirm that we are in front of a major large flake graphite body similar to IMERY'S TIMCAL's deposit 28 miles west of our mine". The following is a summary of Mousseau West Results (Brunet Graphite Deposit):

2013 Vertical Hole #	from	to	Length (m)	Grade %Gp

Sampling including the addition standardized reference material and blanks was carried out at Ste-Véronique's coreshack and samples were shipped to ALS Minerals lab in Val d'Or for graphitic carbon assaying. Drilling, logging and sampling are carried out under the supervision of Mr. Yvan Bussi eres P. Geo.Eng. and Mr. Alain Tremblay P. Geo. Eng. NI 43-101 Qualified Persons. Mr Bussi eres is also responsible for the sampling protocol. Graniz Graphite anticipates receipt of the assay results on an ongoing basis over the next six weeks.
